DETAILED ACTION

Specification

The application has not been checked to the extent necessary to determine the presence of all possible typographical and grammatical errors. Applicant's cooperation is requested in correcting any errors of which he/she may become aware in the application.

The Information Disclosure Statements filed 02/10/2004 have been considered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 5-12, and 14-18 rejected under 35 U.S.C. 103(a) as being unpatentable over Thompson et al (US 6,252,454) in view of Fischer et al (US 5,894,283).

Thompson et al teach in figure (2B) a multistage comparator circuit usable in an analog-to-digital converter, the circuit comprising: a plurality of inverting differential amplifiers (201, 202, 203) connected in series which amplify a sampled input signal, the amplifiers receiving a steady-state current from a programmable source (131, 132, 133); a control circuit (14) connected to each amplifier for directing their respective start and stop times at any point in a period. The circuit of Thompson further comprises a

plurality of switches 111, 121, 112, 122, 113, 123) positioned at inputs and outputs of the amplifiers and programmable to short-circuit each one of them.

Thomson et al do not specifically disclose a sample-and-hold circuit at the input of the series of amplifiers. However, Fischer et al teach in figure (3) a signal conversion apparatus including a sample-and-hold circuit having a plurality of switches and capacitors that sample and hold under the control of a controller an analog input signal, the sample-and-hold circuit generating a signal indicative of a magnitude relation and feeding the input signal to a plurality of amplifiers connected in series. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teachings of Fischer et al into the system of Thompson to improve performance and reliability because this would increase the operating speed of the system (See column 1, lines 41-43).

Allowable Subject Matter

Claims 4 and 13 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
